# Class 10 Structural Bioinformatics

## Eli Haddad A16308227

# 1) Introduction to the RCSB Protein Data Bank (PDB)

First let's see what is in the PDB database - the main repository of protein structures.

Downloaded composition stats from: https://www.rcsb.org/stats/summary

For context: Release 2023\_24 of 13-Sep-2023 of UniProtKB/TrEMBL contains 251600,768 sequence entries. The PDB only contains 183,201

```
stats <- read.csv("Data Export Summary.csv", row.names = 1)
stats</pre>
```

	X.ray	EM	NMR	Multiple.methods	Neutron	Other
Protein (only)	158,844	11,759	12,296	197	73	32
Protein/Oligosaccharide	9,260	2,054	34	8	1	0
Protein/NA	8,307	3,667	284	7	0	0
Nucleic acid (only)	2,730	113	1,467	13	3	1
Other	164	9	32	0	0	0
Oligosaccharide (only)	11	0	6	1	0	4
	Total					
Protein (only)	183,201					
Protein/Oligosaccharide	11,357					
Protein/NA	12,265					
Nucleic acid (only)	4,327					
Other	205					
Oligosaccharide (only)	22					

There is a problem there due to the commas in the numbers. This causes R to treat them as characters.

```
x <- stats$X.ray
  X
[1] "158,844" "9,260"
                          "8,307"
                                     "2,730"
                                                "164"
                                                           "11"
   as.numeric(gsub(",","", x))
[1] 158844
              9260
                      8307
                             2730
                                      164
                                               11
  rm.comma <- function(x) {</pre>
     as.numeric(gsub(",","", x))
  rm.comma(stats$EM)
[1] 11759 2054 3667
                          113
                                         0
I can use apply() to fix the whole table...
  pdbstats <- apply(stats, 2, rm.comma)</pre>
  rownames(pdbstats) <- rownames(stats)</pre>
  head(pdbstats)

Nucleic acid (only)	Other	Oligosaccharide (only)
2.05	0.10	0.01

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

#### SKIPPED for time!!

Protein structures in PDB as a function of UniProt sequences.

```
round((pdbstats[1,"Total"] /251600768) * 100, 2)
```

#### [1] 0.07

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

The resolution (2 Angstroms) is not small enough in order to capture the small size of the hydrogen atoms. That is why hydrogen is not seen anywhere in these structures. You need 1 Angstrom or better to see these smaller atoms.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

This water molecule is called HOH 308. It is important for making direct interactions with the ligand and with the protein.

Q6: Generate and save a figure clearly showing the two distinct chains of HIV-protease along with the ligand. You might also consider showing the catalytic residues ASP 25 in each chain and the critical water (we recommend "Ball & Stick" for these side-chains). Add this figure to your Quarto document.

Here is a lovely figure of HIP-Pr with the catalytic ASP residues, the MK1 compound and the all important water 308

#### The bio3d package for structural bioinformatics

```
library(bio3d)
  pdb <- read.pdb("1hsg")</pre>
 Note: Accessing on-line PDB file
  pdb

# Predicting functional motions of a single structure

Let's finish today with a bioinformatics calculation to predict the functional motions of a PDB structure.

```
adk <- read.pdb("6s36")

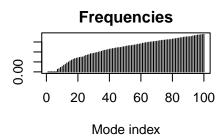

Note: Accessing on-line PDB file
  PDB has ALT records, taking A only, rm.alt=TRUE

m <- nma(adk)

Building Hessian... Done in 0.013 seconds.
Diagonalizing Hessian... Done in 0.275 seconds.

plot(m)</pre>
```

```
mktrj(m, file="adk_m7.pdb")
```

## 4. Comparative structure analysis of Adenylate Kinase

We need some packages for todays class. These include bio3d and msa

The msa package is from BioConductor. These packages focus on genomics type work and are managed by the BiocManager package.

Install install.packages("BiocManager") and then BiocManager:install("msa") all entered in the R "brain" console.

```
library(bio3d)
aa <- get.seq("1ake_A")</pre>
```

Warning in get.seq("1ake\_A"): Removing existing file: seqs.fasta

Fetching... Please wait. Done.

```
60

pdb|1AKE|A
           181
                                                214
  read.fasta(file = outfile)
Class:
  fasta
Alignment dimensions:
  1 sequence rows; 214 position columns (214 non-gap, 0 gap)
+ attr: id, ali, call
Now I can search for the PDB database for related sequences:
  #b <- blast.pdb(aa)</pre>
  #hits <- plot(b)</pre>
  #attributes(b)
  #head(b)
```

These are the related structures in the PDB database that we found via a BLAST search...

```
hits <- NULL
hits$pdb.id <- c('1AKE_A','6S36_A','6RZE_A','3HPR_A','1E4V_A','5EJE_A','1E4Y_A','3X2S_A','
```

Q10. Which of the packages above is found only on BioConductor and not CRAN?

The msa package is found only in BioConductor and not CRAN.

Q11. Which of the above packages is not found on BioConductor or CRAN?:

The Grantlab/bio3d-view is installed using devtools, so this is not found on BioConductor or CRAN.

Q12. True or False? Functions from the devtools package can be used to install packages from GitHub and BitBucket?

True

Q13. How many amino acids are in this sequence, i.e. how long is this sequence?

There are 214 amino acids in this sequence.

Side-note: Lets annotate these structures (in other words find out what they are, what species they are from, stuff about the experiment they were solve in etc.)

For this we can use the pdb.annotate()

```
anno <- pdb.annotate(hits$pdb.id)

#attributes(anno)
head(anno)</pre>
```
